E3.22:

Typical Electric Bills- January 1, 1985

The Typical Electric Bills annual report is prepared by the Electric Power Division, Office of Coal, Nuclear, Electric and Alternate Fuels, Energy Information Administration, Department of Energy.

This report provides comprehensive information on the cost of electricity for representative amounts of electricity used per month as of January 1 of the current year. The source of the information is the Form EIA-826, "Typical Net Monthly Bills," filed annually by 1,016 electric utilities serving approximately 6,000 communities.

Highlights

Average costs of electricity to customers in the residential, commercial, and industrial sectors, as reflected in bills for January 1, 1985, in general, rose moderately over those reported a year ago. The increases in the price of electricity can be attributed to the continuing escalation of the costs encountered by electric utilities in producing electric power.

Residential Sector

The average monthly electric bill for residential consumers increased, just over 4 percent, from $40.18 on January 1, 1984, to $41.86 on January 1, 1985, for a 500-kilowatthour bill (Table 6). A bill of this size typically covers lighting, small appliances, refrigerators, and cooking for a moderate size home. Not included are taxes, such as sales taxes, where the utility acts only as a collecting agent for the tax-imposing authority.

Electric bills in the 500-kilowatthour consumption category show Oregon having the largest percentage increase (15.4 percent) and New Hampshire having the largest percentage decrease (7.3 percent) in 1985 over 1984 (Table 8A). Based on Table 8B, where State bills are ranked from lowest (1) to highest (51) cost, Oregon ranked 3rd and New Hampshire ranked 44th in the 500-kilowatthour category. Oregon's ranking remained unchanged from 1984; New Hampshire's ranking improved by 4 places.

As in previous years, the Middle Atlantic, Noncontiguous (Alaska and Hawaii), and New England Divisions have the highest average bills. This can be attributed to the divisions' dependence on high-cost oil-fired generation. Pennsylvania, in the Middle Atlantic Division has substantial coal-fired generation, but the transmission and distribution system, to some extent, limits the use of this generation to meet loads in the eastern portion of the State. The East South Central Division, for the 500-kilowatthour category, has the lowest average bills. This is attributed to the division's relatively inexpensive coal-fired generation and access to hydroelectric power from the Tennessee Valley Authority. The West North Central Division has the second lowest bills. The largest percentage increase in average bills, on a divisional basis, for the 500-kilowatthour category occurred in the Pacific (9.3 percent) and Mountain (7.0 percent) Divisions. These divisions had less precipitation than the previous year and a decrease of inexpensive hydroelectric generation, which was replaced by more expensive fossil-fueled generation. The commerical operation of new generating units increased the rate base, which resulted in rate increases. The small-

The average monthly electric bills for residential consumers in moderate-sized homes with 500 kilowatthour bills rose 4.2 percent from January 1984 to January 1985.

est increases occurred in the New England (0.1 percent) and East South Central (0.9 percent) Divisions. These divisions had adequate petroleum supplies and stable petroleum prices. The Noncontiguous Division, whose bill increased 11.0 percent in 1984, had a decrease of 0.5 percent in 1985. The Noncontiguous Division, which is dependent on oil-fired generation, showed a decrease due to lower petroleum prices. Table 7 details weighted average bills for residential service by census divisions.

Commercial and Industrial Sectors

As of January 1, 1985, the 10 highest bills, among privately owned utilities for the 30 kilowatt/6,000-kilowatthour commercial service category, reveal that Consolidated Edison Company and San Diego Gas and Electric Company still rank number one and two, respectively. Long Island Lighting Company, with an increase of 11.3 percent, rose from fifth highest bill to third highest bill. For the 10 lowest bills, Idaho Power Company and Montana Power Company rank one and two, respectively. Montana Power Company's decrease in bill, 11.6 percent over the previous year, moved them from fifth lowest bill to second lowest bill (Table 16).

The 10 highest bills among publicly owned utilities, for the same commercial service category, reveal South Norwalk Electric Works and the City of Anaheim, as having the highest bills, by a substantial margin. The City of Anaheim, with an increase of 9.9 percent, climbed from fifth highest bill to second place. Norwalk Third Taxing District dropped from second highest bill to sixth highest bill. Their bill decreased 7.3 percent over the previous year. For the 10 lowest bills, the City of Tacoma and the City of Provo rank one and two, respectively. The City of Provo rose from seventh lowest bill to second lowest bill because of a decrease in bill of 27.0 percent over the previous year. This increase was due to a milder-than-anticipated winter and a decline in the cost of fuel. The City of Seattle, with an increase of 36.9 percent dropped from second lowest bill to sixth lowest bill (Table 17).

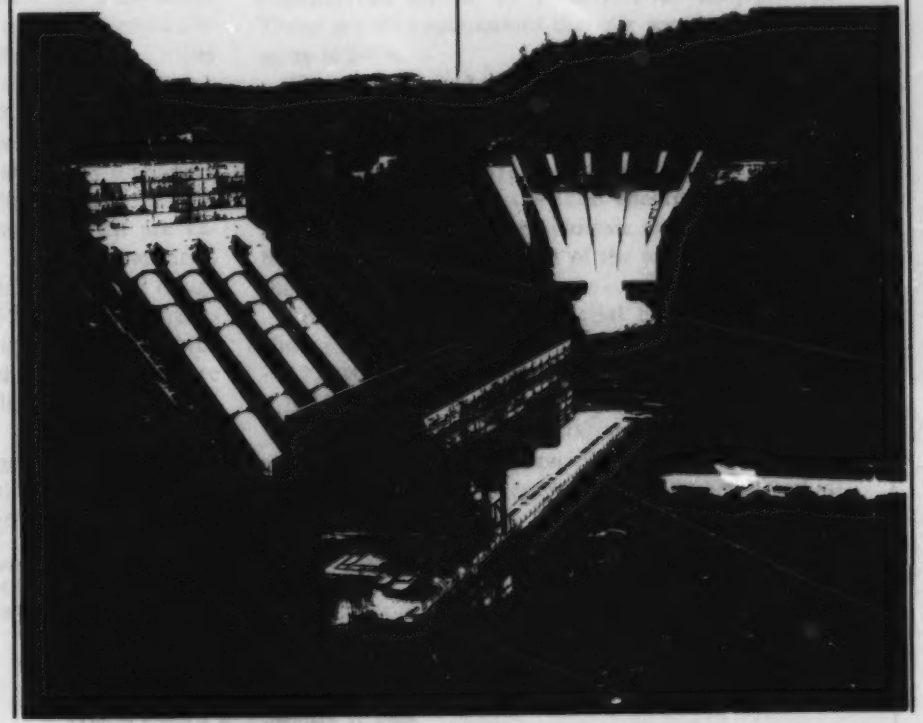
As of January 1, 1985, the 10 highest bills among privately owned utilities for the 1,000 kilowatt/200,000-kilowatthour industrial service category, reveal that, for the first time, San Diego Gas and Electric Company rank first, moving Consolidated Edison Company to second place. This is due to San Diego Gas and Electric Company's continued increase in bills (9.6 percent over the previous year) compared to Consolidated Edison Company's decrease in bills (0.7 percent over the previous year). Hawaiian Electric Company, with a decrease in bills of 3.7 percent, dropped from fourth highest bill to eighth highest bill. Idaho Power Company ranks first among the privately owned utilities having the 10 lowest bills. Montana Power Company, which ranked first over the past two years, dropped to the third lowest bill and had an increase of 47.8 percent over the previous year (Table 30). Part of this rate increase is the inclusion in the rate base of approximately 60 percent of Colstrip #3. Colstrip #3, a coal-fired generating unit, having a nameplate capacity of 778 megawatts, was declared in commercial operation by the Montana Power Company in early 1984. A rate increase partially justified by the commercial operation of Colstrip #3, was filed by the Montana Power Company, with the Montana Public Service Commmission. The Commission approved a smaller rate increase for general escalation of cost and disallowed the inclusion of Colstrip #3 in the rate base, deciding it was not used and useful. A rate increase allowing approximately 60 percent of Colstrip #3, was approved by the Commission in late 1984 and was effective the beginning of 1985. At the time the rate increase was requested for Colstrip #3, a cost of service study for Montana Power Company was conducted and rates between classes of customers were reapportioned. (The Montana Public Service Commission allowed the remainder of Colstrip #3 in the rate base late summer of 1985; it is not reflected in Montana's rates for January 1, 1985, published in this report.)

The 10 highest bills among publicly owned utilities, for the same industrial service category, reveal that South Norwalk Electric Works continues to rank first, with the City of Alameda ranking second. The City of Alameda, showing an increase of 55.1 percent over the previous year, rose from tenth highest bill to second highest bill. Rates were increased due to a lower-than-expected return on investments. For the 10 lowest bills, the City of Tacoma and the City of Eugene rank one and two respectively. The City of Seattle, with an increase of 25.4 percent, moved from second lowest bill to third lowest bill (Table 31).

Utility Updates

During 1984, there were four mergers and additions of two new utilities. The mergers were as follows: Manchester Electric Company (MA) merged with Massachusetts Electric Company (MA); the City of Blair (NE) merged with Omaha Public Power District (NE); Dallas Power and Light Company (TX), Texas Electric Service Company (TX), and Texas Power and Light Company (TX) merged to form a new company, Texas Utilities Electric Company (TX); and the City of Vernon (TX) merged with West Texas Utilities Company (TX). The other new utility added was Nantahala Power and Light Company (NC).

Introduction



1. Introduction

The **Typical Electric Bills** annual report is prepared by the Electric Power Division; Office of Coal, Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA); Department of Energy. The publication is geared to a variety of applications by electric utilities, industry, consumers, educational institutions, and government in recognition of the growing importance of energy planning in a contemporary society.

Sources of Data

This publication is a continuation of reports published from data reported on the annual Form EIA-213, "Typical Net Monthly Bills." These surveys provide comprehensive coverage of the cost to consumers for representative amounts of electricity used per month for residential, commercial, and industrial service in most of the Nation. Bills for residential electric service are reported for 5 different energy consumption levels in all communities with populations of 2,500 or larger. For commercial and industrial service, bills are presented for large cities.[1]

Commercial bills are shown for 6 combinations of billing demands in kilowatts and monthly consumption levels in kilowatthours; industrial bills cover 5 billing demands and 10 consumption levels. The bill categories were chosen to represent various usage levels in each community, and the choices are discussed in detail in the individual chapters.

Present long-term trends and current levels of average electric bills for the residential sector (Tables 6-9) are shown for the total United States, for each State, the District of Columbia, and for the nine Census Divisions. Detailed information on bills for the three types of service in the individual communities as of January 1, 1985, are shown in Tables 11, 25, and 35.2/ In these tables, a plus sign (+) shown beside the community name, reflects a community being served by a publicly owned electric utility. Numbers shown beside the utility serving community, are footnotes which are explained at the end of these tables. Within a rate tariff, there are multiple schedules which are assigned designations by the utility. In Tables 25 and 35 the designation for the utility schedule used to calculate the bills are shown. The bills reported in this publication were computed using the schedule applicable to the majority of customers.

The population data for average bills shown in all figures and tables, with the exception of Tables 10, 24, and 34 are based on the 1980 United States Census data. The population is shown opposite each community in Table 11. Communities served by more than one utility and the percentage of customers currently served are listed in Tables 10 (residential), 24 (commercial), and 34 (industrial).

Tables A1, A2, and A3, of Appendix A, represent weighted bills for rural cooperatives, and publicly and privately owned utilities. The averages for the rural cooperatives are weighted on the number of billed customers.

The bills are calculated under the rate schedules generally applicable to the majority of customers taking service under the conditions and classes of service specified, although utilities may have other rate schedules available that produce different bills from those shown.[3]

This report does not attempt to evaluate the many factors that produce differences in the level of bills (for example, the proximity of fuel sources, type and size of prime mover used in generation, customer density, and utility ownership). This report is to inform the public and the industry of the cost of representative quantities of electricity to business and residential customers in communities throughout the United States. For a description of the data collected on this form, see the "Technical Notes" section of this report.

Coverage of Sources

The Form EIA-213 data source represents electric utilities serving communities with populations of 2,500 or more (1,214 utilities serving over 6,000 communities). However, this survey does not collect data for communities served by rural electric cooperatives. There are 93 communities that are served by two or more utilities.

The population of the 6,606 communities included in this summary represents about two-thirds of the total population of the United States. Because consumers living in areas adjacent to these communities are frequently served under the rate schedules effective in the communities, the bills reported indicate rate levels applicable to more than 70 percent of the total population of the country.

For commercial and industrial coverage, bills are shown for 481 cities with an estimated total population of 77,490,663 as of January 1, 1985. This includes 2,207,071 people located in 29 U.S. cities each with a population of less than 50,000 and 7 cities in Puerto Rico, each with a population of more than 50,000. Typical bill information is reported for commercial and in-

[1] Reference to large cities in this publication includes all communities in the United States with populations of 50,000 or more. In States with fewer than three such cities, the three largest cities, regardless of population, are included.

[2] The Commonwealth of Puerto Rico is included in Tables 11, 25, and 35 but not in the summary tables which are for the 50 States and the District of Columbia.

[3] Rate schedules used to calculate bills are available for public inspection on request.

Introduction

Table 1. Total Communities and Utilities by Census Divisions and Type of Ownership

Census Divisions	Privately owned		Publicly Owned	
	Communities[1]	Utilities	Communities[1]	Utilities
New England	414	23	50	43
Middle Atlantic	1,182	23	50	49
East North Central	1,127	40	162	165
West North Central	386	34	226	215
South Atlantic	747	32	168	152
East South Central	217	9	160	138
West South Central	550	22	119	112
Mountain	242	27	66	52
Pacific	610	14	97	55
Alaska	1	1	4	4
Hawaii	28	4	0	0
Total	**5504**	**229**	**1102**	**985**

[1] Fifty-seven communities served by both privately and publicly owned utilities are counted in each ownership classification.

Source: Energy Information Administration Form EIA-213, "Typical Net Monthly Bills."

dustrial service for 199 utilities, of which 133 are privately owned and 66 are publicly owned.

Cities in the United States with a population of 50,000 or more are served by 182 utilities, of which 120 are privately owned and 62 are publicly owned.

Adjustments to Collected Data

Although submission of the data on Form EIA-213 is voluntary, all efforts are made to obtain a 100 percent response rate. If a utility does not respond, its previous year's data are used with a footnote explanation. The average bill for each consumption level for a State, Census Division, and the United States is calculated by weighting the sample bills collected. See Section 2.6 of the "Technical Notes" for further information.

Glossary

A glossary of terms used in this report has been included to assist nontechnical as well as technical users in understanding and relating the statistical data in this publication. The use of these terms is described in the "Technical Notes."

Technical Notes

The "Technical Notes" contains a detailed description of the data collection system used in preparing this publication. The notes provide explanations of adjustments to collected data, if any, sample weighting, and critical differences in the data. Copies of the data are available to the public. See Section 2.3 of the "Technical Notes" for further information.

Residential Service

2. Residential Service

Residential bills were computed for 5 representative energy consumption categories (250-kilowatthours, 500-kilowatthours, 750-kilowatthours, 1,000-kilowatthours, and 2,500-kilowatthours) for each community as detailed in Table 11. The 250-kilowatthour and 500-kilowatthour bills were chosen to reflect charges for lighting, small appliances, refrigeration, and cooking. The 750-kilowatthour and 1,000-kilowatthour bills were chosen to represent water-heating usage in addition to those uses included in the 250-kilowatthour and 500-kilowatthour specifications. The 2,500-kilowatthour bill was chosen to reflect space-heating usage. Where two bills are shown for the same utility for certain communities listed in Table 11, the second bill is either a "summer bill," computed for certain seasonal months not encompassing January 1, 1985, or computed from rates relating to underground service. Neither type of second bill is included in the State average or in the comparative tables. Special features contained in the rate schedules used in calculating bills are indicated by footnotes following the utility name. The footnotes are explained at the end of the table.

Geographic differences in residential bills as of January 1, 1985, are presented in greater detail in Figures 2-7 and Tables 7-9. The figures show weighted average monthly bills of residential electric consumption for each State, the District of Columbia, and the United States. The coded shading on the maps indicates the quartile distribution of the States, grouped by size of bill.

National Trends

The national weighted average bills in the five consumption categories listed below increased between January 1, 1984, and January 1, 1985. As of January 1, 1985, the increases over the previous year were as follows: 4.8 percent for the 250- kilowatthour, 4.2 percent for the 500-kilowatthour, 5.7 percent for the 750-kilowatthour, 5.0 percent for the 1,000-kilowatthour, and 6.0 percent for the 2,500-kilowatthour bill (Table 6). Average bills measured in current dollars remain higher than at any time during the past 50 years.

The Consumer Price Index (CPI),[4] as of January for each year shown, is listed below to allow for comparison of electricity costs with the general price level. Observe that prior to 1974, except for the lowest consump-

[4] Source: U.S. Department of Labor, Bureau of Labor Statistics.

The highest average residential bills are found in the Middle Atlantic, Noncontiguous, and New England Census Divisions, while the lowest average residential bills, for most consumption levels, are found in the East South Central Census Division.

tion category, the Index of Average Bill (Table 6) was running slightly under the CPI. However, after 1974, following the Arab Oil Embargo, the Index of Average Bill surpassed the CPI. There was also another jump in the Index of Average Bill, between 1979 and 1980, due to the Iran-Iraq conflict and the fear of disruption in the supply of petroleum from the Persian Gulf.

CPI January Computations for Years Indicated

Year	CPI	Year	CPI	Year	CPI
1985	316.1	1977	175.3	1967	100.0
1984	305.2	1976	166.7	1965	93.6
1983	293.1	1975	156.1	1960	87.9
1982	282.5	1974	139.7	1955	80.1
1981	260.5	1973	127.7	1950	70.5
1980	226.6	1972	123.2	1945	53.3
1979	204.7	1971	119.3	1940	41.7
1978	187.2	1970	113.3		

In addition to changes in basic rate structure, other factors, such as the application of fuel adjustments, purchased power cost adjustments, and tax adjustments, may be responsible for changes in bills from those reported last year.

Census Division Patterns

The highest average bills are found in the Middle Atlantic, Noncontiguous, and New England Census Divisions, while the lowest average bills, for most consumption levels, are found in the East South Central Census Division (Table 7).

An analysis of the 50 States and the District of Columbia reveals that the largest percent increases in average bills for 500-kilowatthour consumption occurred in Oregon (15.4 percent) and Michigan (14.1 percent). The smallest percent increases occurred in Tennessee (0.1 percent) and the District of Columbia (0.3 percent). The largest percent decrease (7.3 percent) in average bills from the previous year occurred in New Hampshire (Figure 7).

The number of changes in average bills between 1984 and 1985 for all States and the District of Columbia are summarized below:

Number of Changes in Average Electrical Bills, 1984-1985

	250-kWh	500-kWh	750-kWh	1,000-kWh	2,500-kWh
Increase	41	39	41	40	41
Decrease	10	12	10	11	10

Wide variations in rates within the contiguous States are illustrated in Tables 2-5, showing for both the 250-kilowatthour and the 500-kilowatthour consumption categories the highest and the lowest typical bills charged by 10 privately owned and 10 publicly owned utilities serving communities of 50,000 in population or larger. These bills are taken from Table 11. No adjustment has been made to reflect differences in the services rendered without charge by the two groups of utilities, privately owned and publicly owned.

Attention is directed to the basis for the computations of residential bills, as described in the "Technical Notes." In general, sales taxes are not included but other taxes are. Bills are based on special rates for refrigeration, cooking, water-heating, and space-heating where generally applicable.

Residential Service—Highest and Lowest Bills, Utility

Table 2. Ten Highest and Lowest Bills for Privately Owned Utilities Serving Communities of 50,000 in Population or Larger 250-kWh Consumption, January 1, 1985

Utility	Highest Bill (dollars)	Utility	Lowest Bill (dollars)
Consolidated Edison Co. of New York[1]	40.64	Idaho Power Co.	9.95
Long Island Lighting Co.[1]	36.72	The Washington Water Power Co.	11.35
United Illuminating Co.	33.86	Pacific Power and Light Co.[1]	11.48
Jersey Central Power and Light Co.[1]	32.98	Montana Power Co.[1]	12.08
Hawaiian Electric Co., Inc.	31.20	Portland General Electric Co.[1]	12.51
Northern Indiana Public Serv. Co.	30.62	Potomac Electric Power Co.[1]	12.61
Commonwealth Electric Co.	30.01	Minnesota Power and Light Co.	13.73
Connecticut Light and Power Co.	29.94	Louisiana Power and Light Co.[1]	14.15
Boston Edison Co.[1]	29.93	Northern States Power Co.[2]	14.47
El Paso Electric Co.	29.84	New Orleans Public Service Inc.[1]	14.75

\+ Served by publicly owned utility.
[1] Utility serves the minority of customers. See Table 10.
[2] Utility serves the majority of customers. See Table 10.
[3] Utility serves approximately 50 percent of the customers. See Table 10.
[4] Utility has service contract with Tennessee Valley Authority.
[5] Utility failed to submit data for January 1, 1985. Data shown are those previously reported for January 1, 1984.
[6] Lamp replacement service included.
[7] Bills as reported by utility (data insufficient for verification).
[8] Data based on rates effective during utility-specified winter period (applies to 750-, 1,000-, and 2,500-kWh bills).
[9] No change in bills from previous report.
[10] Data based on rates effective during utility-specified winter period.
[11] Data based on rates effective during utility-specified summer period.
[12] Data computed for service from overhead distribution system--majority of customers.
[13] Data computed for service from underground distribution system--majority of customers.
14-24 Not used.
[25] Rate used may limit use of water-heating devices (applies to 750- and 1,000-kWh bills).
[26] Rate used may limit hours of water-heating devices (applies to 750-, 1,000- and 2,500-kWh bills).
27 Not used.
[28] Customers furnish their own meters.
29-31 Not used.
[32] 750- and 1,000-kWh bills include 350 kWh computed at night rate (night rate is primarily for water-heating service).
[33] 750- and 1,000-kWh bills include 350 kWh computed at night rate; 2,500-kWh bill includes 500 kWh computed at night rate (night rate is primarily for water-heating service).
[34] The additional amount by which bills for underground service exceeds bills for overhead service is only applicable in lieu of one-time contribution.
[35] Rate used includes use of water-heating devices.
[36] Rate used includes use of space-heating devices.

Commercial Service

3. Commercial Service

Bills as of January 1, 1985, for electric service to commercial establishments were computed for six combinations of billing demands and monthly consumptions: 6 kilowatts/750 kilowatthours, 12 kilowatts/1,500 kilowatthours, 30 kilowatts/6,000 kilowatthours, 40 kilowatts/10,000 kilowatthours, 50 kilowatts/ 12,500 kilowatthours, and 100 kilowatts/30,000 kilowatthours. Bills are shown for each schedule within a utility that applies to these demand and consumption levels. Special features contained in the rate schedules used in calculating bills are indicated by footnotes following the utility name. The footnotes are explained at the end of the table. Details for each community are shown in Tables 24 and 25.

Utility Patterns

Wide variations in rates among utilities in the United States are illustrated in Tables 12-23, showing for each consumption category the highest and lowest typical bills charged by 10 privately owned and 10 publicly owned utilities serving communities of 50,000 in population or larger. These bills are taken from Table 25.

An analysis of the 30 kilowatt/6,000-kilowatthour category, for the 10 highest and lowest bills among privately owned utilities, reveal that Consolidated Edison Company and San Diego Gas and Electric Company, with bills decreasing 0.6 percent and increasing 7.7 percent, respectively, continue to lead the way with the highest bills as they did on January 1, 1984. For the 10 lowest bills, Idaho Power Company ranks first. Montana Power Company, whose bill decreased 11.6 percent, rose from fifth lowest to second lowest bill (Table 16).

An analysis of the 30 kilowatt/6,000-kilowatthour category, for the 10 highest and lowest bills among publicly owned utilities, reveal that South Norwalk Electric Works and the City of Anaheim with bills increasing 1.8 percent and 9.9 percent, respectively, have the first and second highest bills. For the 10 lowest bills, the City of Tacoma (no change in bill) and the City of Provo (27.0 percent decrease) have the first and second lowest bills (Table 17).

ide variations in rates among utilities in the United States are illustrated in Tables 12-23, where the highest and lowest pical bills are shown for 10 privately owned and 10 publicly owned utilities serving communities of 50,000 in population or rger.

Commercial Service—Highest and Lowest Bills, Utility

** Letters in this column used to indicate "Type of Service" are: L-(lighting, other uses and single-phase or incidental power); PL-(motive power and incidental lighting); GEN-(all purposes including three-phase power); P-(motive power only including heating but not lighting).

+ Served by publicly owned utility.

[1] Utility serves the minority of customers. See Table 24.

[2] Utility serves the majority of customers. See Table 24.

[3] Utility serves approximately 50 percent of the customers. See Table 24.

Commercial Services Footnotes (Cont.)

[4] Utility has service contract with Tennessee Valley Authority.
[5] Utility failed to submit data for current year. Data shown are those previously reported.
6 Not used.
[7] Bills as reported by utility (data insufficient for verification).
8 Not used.
[9] No change in bills from previous report.
[10] Data based on rates effective during utility-specified winter period.
[11] Data based on rates effective during utility-specified summer period.
[12] Data computed for service from overhead distribution system--majority of customers.
[13] Data computed for service from underground distribution system--majority of customers.
14-23 Not used.
[24] Bills are for contract period in excess of 1 year.

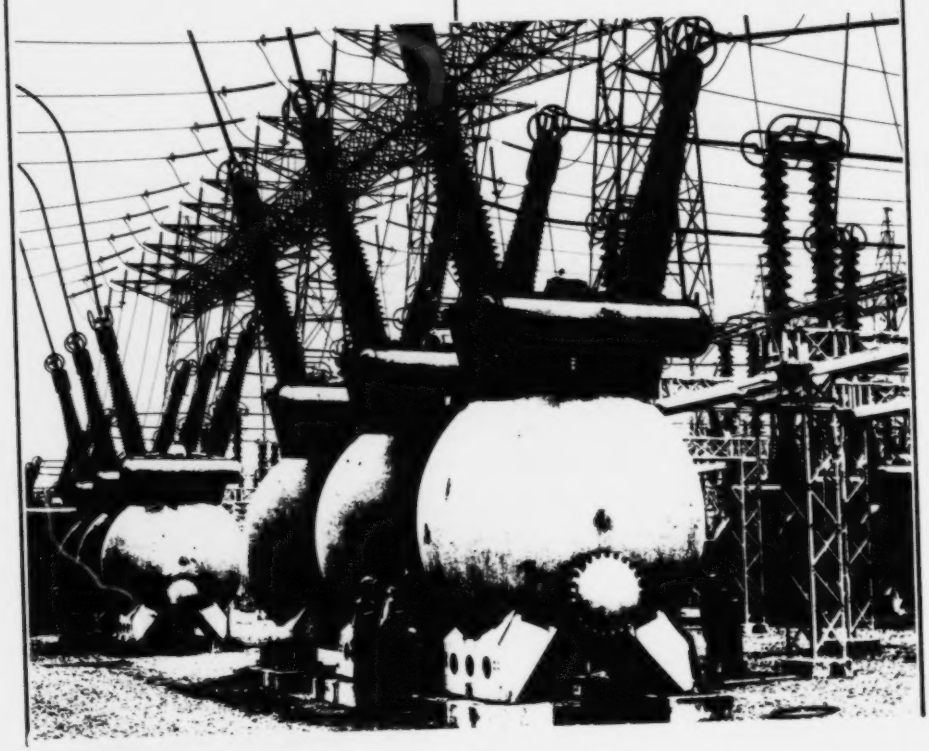
Industrial Service



4. Industrial Service

Bills as of January 1, 1985, for electric service to industrial establishments were computed for two levels of energy consumption (kilowatthour) in each of five billing demand categories (kilowatt). As with commercial service, bills are shown for each schedule within a utility that applies to each of these demand and consumption levels. Special features contained in the rate schedules used in calculating bills are indicated by footnotes following the utility name. The footnotes are explained at the end of the table. Details for each community are shown in Tables 34 and 35.

Utility Patterns

Wide variations in rates among utilities in the United States are shown for the 150 kilowatt/30,000-kilowatthour, 300 kilowatt/ 60,000-kilowatthour, 1,000 kilowatt/200,000-kilowatthour, and 5,000 kilowatt/1,500,000-kilowatthour billing demand/consumption categories as illustrated in Tables 23-33. These tables show the highest and lowest typical bills charged by 10 privately owned and 10 publicly owned utilities serving communities of 50,000 in population or larger. These bills are taken from Table 35.

An analysis of the 1,000 kilowatt/200,000-kilowatthour category, for the 10 highest and lowest bills among privately owned utilities, reveal that San Diego Gas and Electric Company and Consolidated Edison Company, with bills increasing 9.6 percent and decreasing 0.7 percent, respectively, continue to lead the way with the highest bills, as they did on January 1, 1984. For the 10 lowest bills, Idaho Power Company, with a no change in bill, ranks first with the lowest bill, displaced Montana Power Company with the lowest bill (Table 30).

An analysis of the 1,000 kilowatt/200,000-kilowatthour category for the 10 highest and lowest bills, among publicly owned utilities, reveal that South Norwalk Electric Works and the City of Alameda, with bills increasing 1.7 percent and 55.1 percent, respectively, lead the way with the highest bills. Rates were increased, in the City of Alameda, due to a lower- than-expected return on investments. For the 10 lowest bills, the City of Tacoma (no change in bill) and the City of Eugene (no change in bill) have the first and second lowest bill, respectively (Table 31).

In industrial electricity consumption, San Diego Gas and Electric Company for the 1,000 kilowatt/200,000 kilowatthour category, continued to have the highest billings.

Industrial Service—Highest and Lowest Bills, Utility

Table 26. Ten Highest and Lowest Bills for Privately Owned Utilities Serving Communities of 50,000 in Population or Larger-150 kW/30,000-kWh Consumption, January 1, 1985

** Letters in this column used to indicate "Type of Service" are: M-unrestricted motive power; MRL-unrestricted motive power and restricted lighting; MUL-unrestricted lighting in addition to unrestricted motive power.

\+ Served by publicly owned utility.

1 Utility serves the minority of customers. See Table 34.

2 Utility serves the majority of customers. See Table 34.

3 Utility serves approximately 50 percent of the customers. See Table 34.

4 Utility has service contract with Tennessee Valley Authority

5 Utility failed to submit data for current year. Data shown are those previously reported.

6 Not used.

7 Bills as reported by utility (data insufficient for verification).

Industrial Service Footnotes

8 Not used.
[9] No change in bills from previous report.
[10] Data based on rates effective during utility-specified winter period.
[11] Data based on rates effective during utility-specified summer period.
[12] Data computed for service from overhead distribution system--majority of customers.
[13] Data computed for service from underground distribution system--majority of customers.
14-15 Not used.
[16] Data computed for service from overhead distribution center.
17 Not used.
[18] Computed for service at 25 kV or higher.
[19] No adjustment for power factor.
20-21 Not used.
[22] Bills reflect off-peak credit.
23-26 Not used.
[27] Computed under the assumption that less than 30 percent was used during night period.
[28] Computed under the assumption that 50 percent was used during night period.
29 Not used.
[30] Computed under the assumption that billing demand was established during utility-specified peak period.
31-32 Not used.
[33] Computed for service at 34.5 to 69 kV.
[34] Not available in areas served by underground network facilities.
35 Not used.
[36] Data computed for service at 12 to 69 kV.
37-38 Not used.
[39] Energy is metered on secondary side of customer-owned transformer.
[40] Energy is metered on secondary side of utility-owned transformed.
[41] Energy is metered on secondary side of utility-owned transformer (applies to 150 and 300 kW bills).
[42] Energy is metered on secondary side of utility-owned transformer (applies to 150 kW bills).
43 Not used.
[44] Energy is metered on primary side of customer-owned transformer.
[45] Energy is metered on primary side of utility-owned transformer.
46-47 Not used.
[48] Computed for service at 12.5 kV.
[49] 49-50 Not used.
[51] Computed for service at 12 kV.
52 Not used.
[53] Computed for service at 12 kV or higher.
54 Not used.
[55] Computed for service at 13.2 kV or higher.
[56] Computed for service at 13.2 kV or higher (applies to 300-, 500-, 1,000-, and 5,000-kW bills).
[57] Computed for service at 13.8 kV.
58-59 Not used.
[60] Computed for service at 22 or 38 kV.
61-62 Not used.
[63] Computed for service at 23 to 46 kV (applies to 300-, 500-, 1,000-, and 5,000-kW bills).
64 Not used.
[65] Computed for service at 26.4 kV or higher (applies to 300-, 500-, 1,000-, and 5,000-kW bills).
[66] Computed for service at 27.6 kV or higher.
67-70 Not used.
[71] Computed for service at 66 kV or higher.
[72] Computed for service at 44 kV or higher.
73-74 Not used.
[75] Computed for service at transmission or primaryline voltage of less than 69 kV.
Source: Energy Information Administration Form EIA-213, "Typical Net Monthly Bills."

Glossary

Glossary

Ampere: The unit of measurement of electrical current produced in a circuit by 1 volt acting through a resistance of 1 ohm. (See Current, Ohm, Volt.)

Base Bill: A charge calculated by taking the rate from the appropriate electric rate schedule and applying it to the level of consumption. (See Electric Rate Schedule.)

Base Rate: A fixed amount charged each month for any of the classes of utility service provided to a customer. (See Electric Rate Schedule.)

Block Rate Schedule: An electric rate schedule with a provision for charging a different unit cost for various increasing blocks of demand or energy. A reduced price is charged on succeeding blocks. (See Electric Rate Schedule.)

Capacity: The amount of electric power delivered or required for which a generator, turbine, transformer, transmission circuit, station, or system is rated by the manufacturer. (See Installed Nameplate Capacity.)

Census Divisions: The nine geographic divisions of the United States established by the U.S. Bureau of the Census for statistical analysis. The boundaries of the Census Divisions are congruent with State boundaries. For purposes of this publication, the Pacific Division is subdivided into the Pacific Contiguous and Pacific Noncontiguous Divisions.

Classes of Service: Customers grouped by similar characteristics in order to be identified for the purpose of setting a common rate for electric service. Usually classified into groups identified as residential, commercial, industrial, governmental, and other similar groupings within each classification. (See Electric Rate Schedule.)

Commercial and Industrial: Classes of service supplied to similar grouping of customers. These customer groupings are usually subdivided into smaller segments by classifying such customers as Commercial or Industrial using the Federal Government's Office Of Management and Budget's Standard Industrial Classification Guide and/or a scale of energy usage as yardsticks; other customers are reclassified as Commercial or Industrial when their demands or annual use exceeds some specified limit. These limits are generally based on a utility's rate schedules, except for those customers that are supplied under special contracts or agreements calling for particular services. (See Classes of Service.)

Commercial Retail Prices of Electricity: The price of electricity supplied to commercial or business establishments such as stores, offices, restaurants, and garages for lighting and other power purposes.

Commercial Service: Service to customers engaged primarily in the sale of goods or services, including institutions and government agencies.

Consumer Price Index: This index is issued by the U.S. Department of Labor, Bureau of Labor Statistics as a measure of average changes in the retail prices of goods and services usually bought by the families of wage earners and clerical workers living in cities. It was formerly entitled "Consumer's Price Index for Moderate-Income Families in Large Cities Combined."

Consumption (Fuel): The amount of fuel used for gross generation, providing standby service and start-up and/or flame stabilization. (See Fuel.)

Cost: The amount paid to acquire resources such as plant and equipment, fuel, or labor services. Fixed costs in the electric utility industry are associated with resources that cannot be changed easily during a short time span (such as plant and equipment) and are independent of the level of generation. Variable costs are associated with resources that can vary during a given time period (such as fuel or labor services) and are directly related to the level of generation.

Cost of Service: A ratemaking concept used for the design and development of rate schedules to ensure that the filed rate schedules recover only the cost of providing the electric service at issue. This concept attempts to correlate the utility's costs and revenue with the service provided to each of the various customer classes.

Current: A flow of electrons in an electrical conductor. The strength or rate of movement of the electricity is measured in amperes. (See Ampere, Ohm, Volt.)

Customer Charge: An amount charged periodically to a customer for such utility costs as billing and meter reading, without regard to demand or energy consumption. (See Tariff, Electric Rate Schedule.)

Declining Block Rates: An electric rate structure in which the charge for energy decreases as the amount of energy consumed increases. (See Electric Rate Schedule.)

Demand: The rate at which electric energy is delivered to or by a system, part of a system, or piece of equipment, at a given instant or averaged over any designated period of time.

Demand Charge: That portion of the customer's bill for electric service that reflects a customer's contract, and/or special facilities requirements. (See Tariff, Electric Rate Schedule.)

Demand Interval: The time period during which flow of electricity is measured in order to determine demand. These time periods are usually in 15, 30, or 60 minute increments. (See Demand.)

Docket: A formal record of a Federal Energy Regulatory Commission proceeding. These records are available for inspection and copying by the public. Each individual case proceeding is identified by an assigned number. (See FERC.)

Glossary

EIA: The Energy Information Administration. An independent agency within the U.S. Department of Energy that develops surveys, collects energy data, does analytical and modeling analysis of energy issues. The agency must meet the requests of Congress, other elements within the Department of Energy, FERC, the executive branch, its own independent needs, and assist the general public, or other interest groups without taking a policy position.

Effective Rates: Electric rate schedules that have been approved by FERC. (See Electric Rate Schedule, Electric Rate.)

Electric Plant: A station containing prime movers, electric generators, and auxiliary equipment for converting mechanical, chemical, and/or fission energy into electric energy.

Electric Power Industry: The public, private, and cooperative electric utility systems of the United States taken as a whole. This includes all electric systems serving the public: regulated investor-owned electric utility companies; Federal power projects; State, municipal and other government-owned systems, including electric public utility districts; electric cooperatives, including generation and transmission entities ("G and T's"); jointly owned electric utility facilities, and electric utility facilities owned by a lessor and leased to an electric utility firm. Excluded from this list are the special purpose electric facilities or systems that do not offer service to the public.

Electric Rate: The price set for a specified amount and type of electricity by class of service in an electric rate schedule or sales contract. (See Electric Rate Schedule.)

Electric Rate Schedule: A statement of the electric rate and the terms and conditions governing its application; including attendant contract terms and conditions that have been accepted by a regulatory body with appropriate oversight authority. (See Filing.)

Electric Utility: A corporation, person, agency, authority, or other legal entity or instrumentality that owns and/or operates facilities within the United States, its territories, or Puerto Rico for the generation, transmission, distribution, or sale of electric energy, primarily for use by the public.

Energy: The capacity for doing work as measured in the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic energy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kilowatthours, while heat energy is usually measured in British thermal units. (See Energy Source.)

Energy Charge: That portion of the customer's bill for electric service that reflects a customer's energy (kWh) use over a specified billing period. (See Tariff, Electric Rate Schedule.)

Energy Source: The primary source that provides the power that is converted to electricity through chemical, mechanical, or other means. Energy sources include coal, petroleum and petroleum products, gas, water, uranium, wind, sunlight, geothermal, and other sources.

Federal Energy Regulatory Commission (FERC): The Federal agency with jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates and gas pipeline certification. It is an independent regulatory agency within the Department of Energy.

File Rate Schedule: The rate for a particular electric service, including attendant contract terms and conditions, accepted for filing by a regulatory body with appropriate oversight authority. (See Electric Rate Schedule.)

Filing: Any written application, complaint, declaration, petition, protest, answer, motion, brief, exception, rate schedule, or other pleading, amendment to a pleading, document, or similar paper that is submitted to a utility commission. (See Docket, Ratemaking Authority.)

Fuel: Any substance that can be burned to produce heat; also, materials that can be fissioned in a chain reaction to produce heat.

Fuel Cost Adjustment Clause: Terms and conditions found in a rate schedule that allow the amount of the customer's electric bill to change as the cost of fuel varies from a specified base amount. (See Electric Rate Schedule.)

Generation: The process of producing electric energy by transforming other forms of energy; also, the amount of electric energy produced, expressed in kilowatthours (kWh). (See Electric Plant, Energy.)

Horsepower: A unit for measuring the rate of work (or power) equivalent to 33,000 foot-pounds per minute or 746 watts. (See Watt.)

Industrial Retail Prices of Electricity: Price of electricity supplied to industrial establishments such as automotive and steel producing industries.

Installed Nameplate Capacity: The full-load continuous rating of a generator, prime mover, or other electrical equipment under specified conditions as designated by the manufacturer. It is usually indicated on a nameplate attached physically to the equipment. Installed station capacity does not include auxiliary or house units.

Glossary

Inverted Rate Design: A rate design for a customer class for which the unit charge for energy increases as usage increases.

Kilovolt (kV): One thousand volts. (See Volt.)

Kilowatt (kW): One thousand watts. (See Watt.)

Kilowatthour (kWh): One thousand watthours. (See Watthour.)

Load (Electric): The amount of electric power delivered or required at any specific point or points on a system. The requirement originates at the energy-consuming equipment of the customers.

Maximum Demand: The greatest of all demands of the load that has occurred within a specified period of time.

Megawatt (MW): One million watts. (See Watt.)

Megawatthour (MWh): One million watthours. (See Watthour.)

Ohm: The unit of measurement of electrical resistance. The resistance of a circuit in which a potential difference of 1 volt produces a current of 1 ampere. (See Ampere, Current, Volt.)

Peak Load: The maximum load during a specified period of time.

Percent Difference: The relative change in a quantity over a specified time period. It is calculated as follows: The current value number has the previous value number subtracted from it, and this new number is divided by the absolute value of the previous value number; then this new number is multiplied by 100.

Power: The rate at which energy is transferred, usually measured in watts. Also used for a measurement of capacity. (See Capacity, Energy, Watt.)

Power Factor: The ratio of real power (kW) to apparent power (kVA) for any given load and time. (See Power.)

Price: The amount of money or consideration-in-kind for which a service is bought, sold, or offered for sale.

Privately Owned Electric Utility: A class of ownership found in the electric power industry where the utility is regulated and authorized to achieve an allowed rate of return. (See Electric Power Industry, Rate Base.)

Proposed Rates: New electric rate schedule proposed by an applicant to become effective at a future date.

Publicly Owned Electric Utility: A class of ownership found in the electric power industry. This group includes those utilities operated by municipalities, and State and Federal power agencies.

Purchase Power Adjustment : A clause in a rate schedule that provides for adjustments to the bill when energy from other electric system is acquired and its cost varies from a specified unit base amount.

Rate Schedule (Electric): A statement of the financial terms and conditions governing a class or classes of utility services provided to a customer. Approval of the schedule is given by the appropriate ratemaking authority. (See Ratemaking Authority, Regulation, Procedures, and Practices.)

Ratemaking Authority: A utility commission's legal authority to fix, modify, approve or disapprove rates as determined by the powers given the commission by a State or Federal legislature. (See Regulation, Procedures, and Practices.)

Rates: The authorized charges per unit or level of consumption for a specified time period for any of the classes of utility services provided to a customer. (See Electric Rate Schedule.)

Regulation, Procedures, and Practices: A utility commission carries out its regulatory functions through rulemaking and adjudication. Under rulemaking, the utility commission may propose a general rule or regulation change. By law, it must issue a notice of the proposed rule and a request for comments is also made; the Federal Energy Regulatory Commission publishes in the Federal Register. The final decision must be published. An utility commission may also work on a case-by-case basis from submissions from regulated companies or others. Objections to a proposal may come from the commission, or intervenors in which case the proposal must be presented to a hearing presided over by an administrative law judge. The judge's decision may be adopted, modified, or reversed by the utility commissioners in which case those involved can petition for a rehearing, and may appeal a decision through the courts system to the U.S. Supreme Court. (See Ratemaking Authority.)

Residential: A classification covering electric energy supplied for residential (household) purposes. The classification of an individual customer's account where the use is both residential and commercial is based on principal use.

Residential Retail Prices of Electricity: Price of electricity supplied to residential customers for lighting, refrigeration, cooling, water heating, and other domestic uses.

Schedule: A Statement of the pricing format of electricity and the terms and conditions governing its application. (See Electric Rate Schedule.)

Seasonal Rates: Different seasons of the year are structured into an electric rate schedule whereby an electric utility provides service to consumers at different rates. The electric rate schedule usually takes into account demand based on weather and other factors.

Seasonal Rate Schedule: An electric rate schedule containing an electric rate available only during specified seasons of the year. (See Electric Rate Schedule.)

Service Area: The territory in which a utility system or distributor is authorized to provide service to consumers. (See Electric Power Industry.)

Glossary

Tariff: A published volume of rate schedules and general terms and conditions under which a product or service will be supplied. (See Electric Rate Schedule.)

Time-of-Day Rate: The rate charged by an electric utility for service to various classes of customer. The rate reflects the different costs of providing the service at different times of the day. (See Electric Rate Schedule.)

Total Bill: An itemized Statement of fees and charges that consist of the base bill plus State and local taxes and other charges. These charges can include environmental surcharges, franchise taxes, purchase power adjustments, fuel adjustments and any other taxes passed onto the customer from State and local governments which are collected by the utility.

Volt: The unit of measurement of electrical force or pressure. The electrical force that, if steadily applied to a circuit with a resistance of 1 ohm, will produce a current of 1 ampere. (See Ampere, Current, Ohm.)

Watt: The electrical unit of power. The rate of energy transfer equivalent to 1 ampere flowing under a pressure of 1 volt at unity power factor. (See Ampere, Current, Power, Volt.)

Watthour (Wh): An electrical energy unit of measure equal to 1 watt of power supplied to, or taken from, an electric circuit steadily for 1 hour.

Appendix B

Technical Notes

Technical Notes

1. Sources of Data

The Office of Coal, Nuclear, Electric and Alternate Fuels (CNEAF) is responsible for routine data improvement and quality assurance activities. All operations of CNEAF are done in accordance with formal standards established by EIA. These standards are the measuring rod necessary for quality statistics. Data improvement efforts include verification of data-keyed input by automatic computerized methods, editing by subject matter specialists, and follow-up on utilities that have not yet returned the required form. Completed forms received by the CNEAF are sorted, screened for completeness of reported information, and keyed onto computer tapes for storage and transfer to data bases on random access storage devices for computer processing. The information coded on the computer tapes is spot checked against the forms by hand to certify accuracy of the tapes. To insure the quality standards established by EIA, we have designed and implemented algorithms using the past history of data values in the data base to check data input automatically for errors. This reduces the possibility of erroneous entries in the data bases over time as the algorithms become more refined. Data values rejected by the algorithm are checked with respondents by telephone to correct the problems. Respondent computerized data files are checked to identify those who fail to respond to the survey. In those cases, EIA tries to obtain the required information by encouraging cooperation of nonrespondents.

1.1. Form EIA-213 "Typical Net Monthly Bills"

Summary Statement of the Form EIA-213

The Form EIA-213 (formerly FPC Form 3), "Typical Net Monthly Bills," is filed annually by electric utilities serving communities with a population of 2,500 or more. Three schedules are contained in the form: Schedule 1 - indicating typical net monthly bills for power at retail rates for residential service for all communities of 2,500 or more in population; Schedules 2 and 3 - indicating typical net monthly bills for power at retail rates for commercial and industrial service, respectively, for all communities of 50,000 or more in population or for the 3 largest cities in states with fewer than 3 cities of 50,000 in population.

Instrument and Design History

The FPC Form 3, which expired June 30, 1979, was implemented by the former Federal Power Commission in 1934. This form became the responsibility of the Energy Information Administration in October 1977 when the Federal Power Commission was merged into the Department of Energy. Except for minor revision, data reported on Form EIA-213 are the same as reported on FPC Form 3.

Data Processing

The processing of data reported on Form EIA-213 is currently the responsibility of the Office of Coal, Nuclear, Electric and Alternate Fuels; Electric Power Division; Data Systems Branch. The Form EIA-213 is mailed to 1,214 electric utilities serving over 6,000 communities. The forms are mailed the last week in December and are to be completed and returned by the 21st of January, indicating electric bill data as of January 1 of the current year. Data previously reported are preprinted on the forms, and respondents are requested to make the necessary changes.

On receipt, the forms are manually logged in and edited before being sent for keypunching. Data are then entered into the Typical Electric Bills sequential file on the EIA IBM System 3033.

Follow-up letters citing failure to file the required form are mailed to all nonrespondents; if no response occurs as a result of mailing the follow-up letters, respondents are telephoned to have the appropriate data submitted to this office. While larger utilities are contacted until the requested data are submitted, the previous year's data may be published for smaller utilities. When this occurs, it is footnoted.

Analysis

Computer programs are run to give an output of average typical electric bills of communities throughout the United States for residential service for various consumption levels. In addition, average typical electric bills are computed for each State and the District of Columbia at various consumption levels. Similar computations are made for the different census divisions of the country. Comparisons of the data are made to that of previous years. Explanations are given on national trends and census division patterns.

2. Quality of Data

The edit systems are automated to edit data from the survey forms. The edit includes both deterministic checks, in which records are checked for the presence of required fields and their validity, and statistical checks, in which estimation techniques are used to validate data according to its behavior in the past and in comparison to other current fields. When all data have passed the edit process, the system builds master files. These master files are used as input to the **Typical Electric Bills**.

2.1. Estimation Procedures

Missing data values are estimated by using the previous year's data. This approach is used to minimize the time in producing the report until further analysis of the data in our data bases is performed.

When all data in a table are estimates, the table title includes the word "estimated." To indicate that an individual cell of a table contains estimated data, a capi-

tal "E" (to the left of the number) and an accompanying footnote are used. Subtotals and totals do not indicate "E" if the table clearly shows that any or all the components are estimates. Similarly, any values which clearly are calculated from estimated data are not footnoted.

Electric Power Division Data Revision and Correction Policy

The Electric Power Division has adopted the following policy with respect to the revision and correction of data published in energy data reports and made available in a machine format:

1. All data collected by this office (excluding secondary source data) will be published as preliminary data when first appearing in an energy data report.
2. The next publication of the data will be in final form when the data bases are closed.
3. Revisions or corrections will only be made in the event a substantial (greater than 1 percent) reporting change is received or a substantial (greater than 1 percent) error is discovered.
4. Revisions or corrections to published secondary source data will be made if and when the organization from which the data was received revises or corrects the data.
5. No revisions will be made without the approval of the Director, Electric Power Division.

2.2. Confidentiality of the Data

The data collected on the forms used for input to this report are not confidential.

2.3. Obtaining Copies of Data

Upon EIA approval of the **Typical Electric Bills**, the data become available for public use in custom computer runs on a cost-recovery basis. Computer listings are obtained by submitting a written request with a check for $25.00, payable to the U.S. Treasurer, to the following address:

National Energy Information Center, EI-22
Energy Information Administration Forrestal
Building Room 1F-048 Washington, DC 20585

These data are also available on machine-readable tapes. Tapes may be purchased by using Visa, MasterCard, or American Express Cards as well as money orders or checks payable to the National Technical Information Service (NTIS). Purchasers may also use NTIS and GPO depository accounts. Single issues on tape sell for $140.00 each, while standing orders for a title sell for $120.00 per tape, on a subscription basis.

To place an order, contact:

National Energy Information Center, EI-22
Energy Information Administration Forrestal
Building Room 1F-048 Washington, DC 20585
(202) 252-8800

2.4. Use of the Glossary

The terms in the glossary have been defined for general use. Restrictions on the definitions as used in these data collection systems are included in each definition when necessary to define the terms as they are used in this report.

2.5. Specifications for Bill Computations

Copies of the specifications under which typical bills are computed are available from the National Energy Information Center, U.S. Department of Energy - Energy Information Administration, Washington, DC 20585. Special rates for refrigeration, cooking, water heating, or space heating where generally applicable, are used in computing the bill for the appropriate blocks of residential service, as indicated in the captions of the basic table. Fuel adjustments, commodity adjustments, and tax adjustments where the tax is imposed on the utility and not on the customer, and other similar adjustments, have been included in the computations where applicable. Not included in the bills reported are sales taxes not covered by the rate schedule, which are computed separately as provided by law and which are levied on the customer where the utility acts only as collecting agent for the tax-imposing authority.

2.6. Weighted Average

The average bill for each energy consumption level and economic sector for a State is calculated by multiplying the bill for each community included by its population and dividing the sum of such products for all communities in the State by the sum of their populations. Where two or more utilities serve a community with different bills, the population for each bill is determined by the proportion of customers served.

The average bill for a Census Division and the United States is calculated by multiplying the average bill for the States in the area by its sample population and dividing the sum of such products for all states in the area by the sum of their sample populations. An alternative method would be to use the total census population for each State in place of the sample population. The table below details the 1980 census population and sample population and the percent of the sample for each State, the District of Columbia, and the United States. Also shown is the ratio of the sample State percent to the sample United States percent. These ratios show the relative weighting used for each State.

Technical Notes (continued)

State Name	1980 Population (Census)	1980 Population (Sample)	Sample/ Census (Percent)	Sample %/ Sample U.S. Total %
Alabama	3,893,888	2,066,629	53.1	0.83
Alaska	401,851	231,605	57.6	.90
Arizona	2,718,215	1,980,816	72.9	1.13
Arkansas	2,286,435	1,087,960	47.6	.74
California	23,667,902	19,832,270	83.8	1.30
Colorado	2,889,964	1,975,354	68.4	1.06
Connecticut	3,107,576	2,337,858	75.2	1.17
